You must have:
Ruler, calculator

Total Marks

Instructions

- Use **black** ink or ball-point pen.
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer **all** questions.
- Answer the questions in the spaces provided
  – *there may be more space than you need.*
- Show all the steps in any calculations and state the units.
- Some questions must be answered with a cross in a box ☒. If you change your mind about an answer, put a line through the box ☒ and then mark your new answer with a cross ☒.

Information

- The total mark for this paper is 60.
- The marks for **each** question are shown in brackets
  – *use this as a guide as to how much time to spend on each question.*

Advice

- Read each question carefully before you start to answer it.
- Write your answers neatly and in good English.
- Try to answer every question.
- Check your answers if you have time at the end.

Answer ALL questions.

1 The table shows some information about five gases.

Gas	Formula of molecule	Boiling point in °C
chlorine	Cl_2	–35
oxygen	O_2	–183
carbon monoxide	CO	–191
nitrogen	N_2	–196
hydrogen	H_2	–253

Choose gases from the table to answer this question.

You may use each gas once, more than once, or not at all.

(a) Name the gas that is a compound.

(1)

.....

(b) Name the gas necessary for rusting to occur.

(1)

.....

(c) Name the gas that bleaches moist litmus paper.

(1)

.....

(d) Name the gas that has the highest percentage by volume in air.

(1)

.....

(e) Name the gas that has the highest boiling point.

(1)

.....

(f) Determine the two gases that have the same relative formula mass.

(1)

1 .....

2 .....

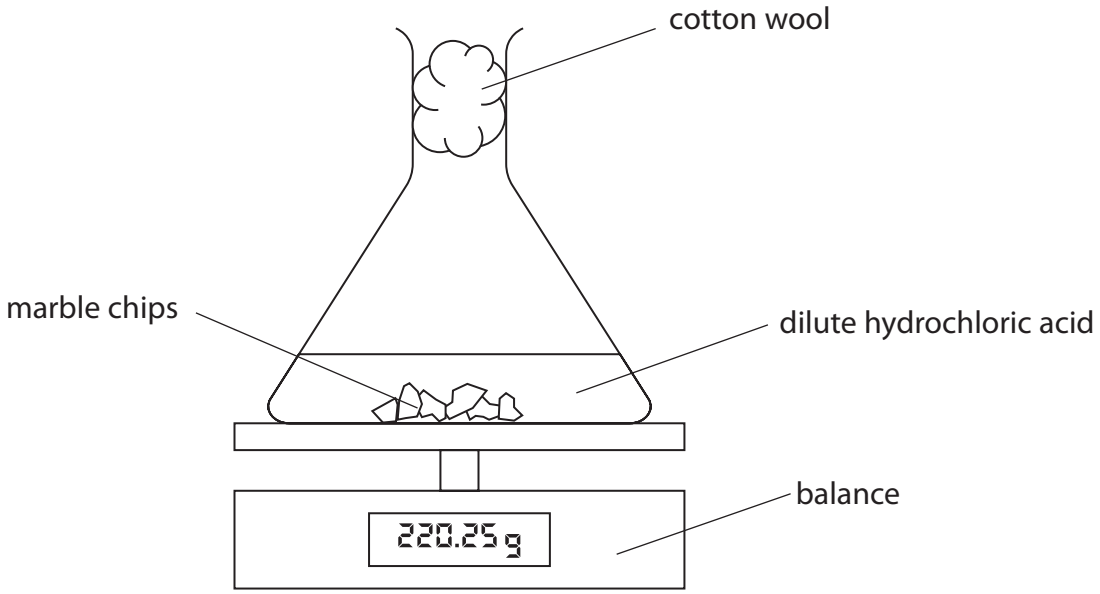
2 A student uses this apparatus to study the rate of the reaction between marble chips and dilute hydrochloric acid.



She uses this method.

- place a conical flask on a balance
- put 15 g of large marble chips in the flask
- add 25 cm^3 of dilute hydrochloric acid to the flask
- record the mass of the flask and contents, and start a timer
- record the mass of the flask and contents every 30 seconds until the reaction ends

The equation for the reaction is

$$CaCO_3(s) + 2HCl(aq) \rightarrow CaCl_2(aq) + CO_2(g) + H_2O(l)$$

(a) (i) Explain what happens to the mass of the flask and contents during the reaction.

(2)

.....

.....

.....

.....

(ii) State why the reaction ends, even though some marble chips remain in the flask.

(1)

.....

.....

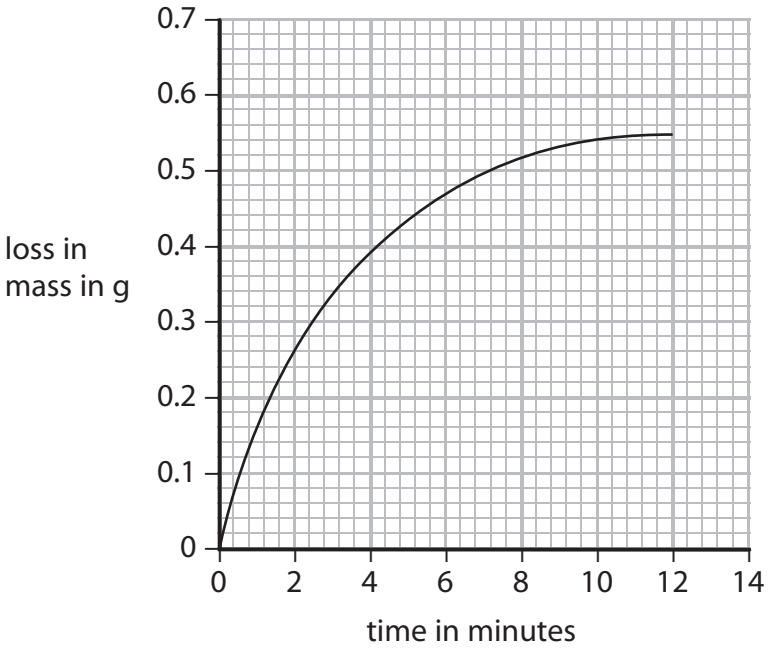
(iii) State how the student would know when the reaction has ended.

(1)

.....

.....

(b) The student plots her results on a grid.



(i) At which time is the rate of reaction greatest?

(1)

☒ **A** 1 minute

☒ **B** 4 minutes

☒ **C** 6 minutes

☒ **D** 8 minutes

(ii) The student repeats the experiment with the same volume and concentration of acid, but with 15 g of smaller marble chips.

On the grid, sketch the curve you would expect for this experiment.

(2)

(c) Explain how decreasing the concentration of the hydrochloric acid affects the rate of reaction.

Refer to particle collision theory in your answer.

(3)

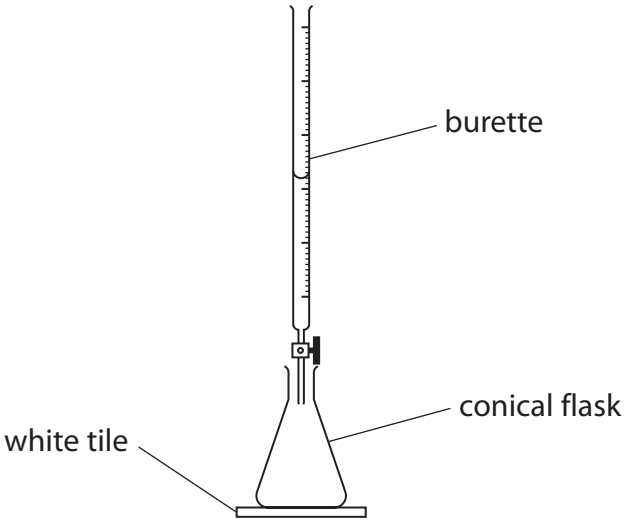
BLANK PAGE

3 A student is provided with a solution of sodium hydroxide, NaOH, and a solution of 0.0200 mol/dm^3 phosphoric(V) acid, H_3PO_4

She does a titration to find the volume of the phosphoric(V) acid that reacts with 25.0 cm^3 of the sodium hydroxide.



This is the student's method.

- add phosphoric(V) acid to a clean burette until it is nearly full
- record the burette reading
- use a measuring cylinder to add 25.0 cm^3 of the sodium hydroxide to a clean conical flask
- add a few drops of phenolphthalein indicator to the flask
- place the flask on a white tile
- add phosphoric(V) acid from the burette until the indicator changes colour
- record the burette reading
- wash the flask using distilled water and then dry the flask
- repeat the titration

(a) (i) Name a piece of apparatus that would give a more precise measurement of the volume of sodium hydroxide.

(1)

.....

(ii) Suggest why the student places the flask on a white tile.

(1)

.....

.....

(iii) Give the colour change of the phenolphthalein indicator during the titration.

(2)

at start .....

at end .....

(iv) The student dries the flask after washing it with distilled water.
Suggest why it is not necessary to dry the flask before repeating the titration.

(1)

.....

.....

.....

DO NOT WRITE IN THIS AREA

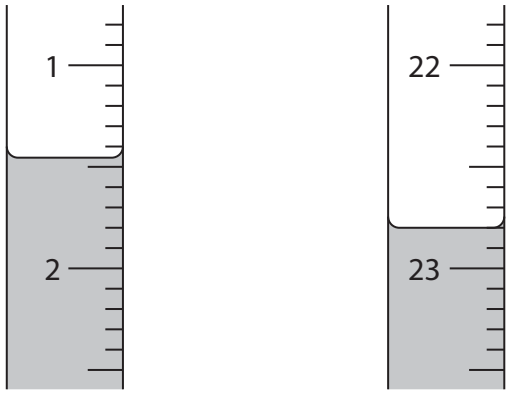
(b) The diagram shows the student's burette readings for her titration, before and after adding the acid.



Use the readings to complete the table, giving all values to the nearest 0.05 cm^3.

(2)

burette reading after adding the acid	22.80
burette reading before adding the acid	
volume in cm^3 of acid added	

(c) Another student does the experiment four times.

The table shows his results.

Volume in cm^3 of acid added	21.80	21.50	21.35	21.40
Concordant results (✓)				

Concordant results are those within 0.20 cm^3 of each other.

(i) Place ticks in the table to show which results are concordant.

(1)

(ii) Use the concordant results to calculate the average (mean) volume of acid added.

(2)

average volume = ... cm^3

(d) The titration is repeated many times.

The average result from all these titrations shows that 25.0 cm^3 sodium hydroxide reacts with 21.30 cm^3 of 0.0200 mol/dm^3 phosphoric(V) acid.

The equation for the reaction is

$$H_3PO_4 + 3NaOH \rightarrow Na_3PO_4 + 3H_2O$$

Calculate the concentration, in mol/dm^3, of the sodium hydroxide solution.

(3)

concentration of sodium hydroxide solution = ... mol/dm^3

(Total for Question 3 = 13 marks)

4 The box shows the molecular formulae of some organic compounds.

P CH_4	**Q** C_2H_4	**R** C_2H_6
S C_3H_6	**T** $C_2H_4Br_2$	**U** C_4H_8

(a) Choose compounds from the box to answer this question.

You may use each compound once, more than once or not at all.

(i) Identify a compound that is not a hydrocarbon.

(1)

.....

(ii) Identify a compound that has the same empirical formula as its molecular formula.

(1)

.....

(b) (i) Draw the displayed formula for compound P.

(1)

(ii) Draw the displayed formula for two straight-chain isomers of compound U.

(2)

Isomer 1	Isomer 2

(c) (i) Compound Q reacts with bromine to form compound T.

Describe the observation that would be made during this reaction.

(1)

.....

.....

(ii) Suggest how compound R could be converted into compound T.

(2)

.....

.....

.....

.....

(d) Compound Q is used as the starting material in the manufacture of polymers such as poly(ethene) and poly(chloroethene).

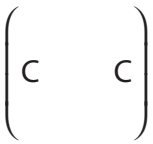
(i) What type of polymers are poly(ethene) and poly(chloroethene)?

(1)

.....

(ii) Complete the diagram to show the displayed formula of poly(chloroethene).

(2)



(e) Nylon is a polymer formed by a different polymerisation process.

(i) Give the name of this polymerisation process.

(1)

.....

(ii) State a difference between the two polymerisation processes.

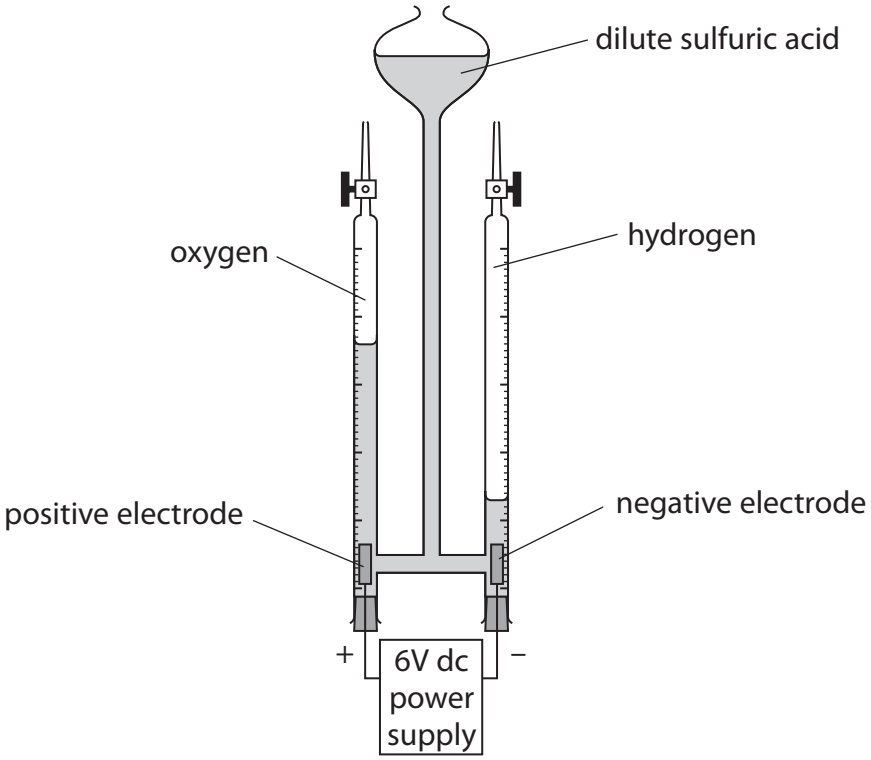
(1)

.....

.....

(Total for Question 4 = 13 marks)

5 This apparatus is called a Hofmann voltameter. It is used to collect the gases produced when an electric current passes through a solution of dilute sulfuric acid.



(a) (i) Name the process that takes place in the Hofmann voltameter.

(1)

.....

(ii) State why zinc should not be used for the electrodes.

(1)

.....

(b) (i) Describe a test to show that the gas produced at the positive electrode is oxygen.

(1)

.....

.....

(ii) Write an ionic half-equation to represent the reaction that produces hydrogen at the negative electrode.

(1)

.....

(c) An ionic half-equation for the reaction at the positive electrode is

$$2H_2O \rightarrow O_2 + 4H^+ + 4e^-$$

Calculate the maximum volume of oxygen that could be formed at room temperature and pressure (rtp) if a charge of 0.010 faraday is passed through the dilute sulfuric acid.

[molar volume of oxygen gas is 24 000 cm^3 at rtp]

(3)

maximum volume of oxygen = ... cm^3

(d) The ionic half-equation for the reaction at the positive electrode is sometimes shown as

$$4OH^- \rightarrow O_2 + 2H_2O + 4e^-$$

Suggest why this half-equation is not the best way to show the reaction at the positive electrode when an electric current is passed through a solution of dilute sulfuric acid.

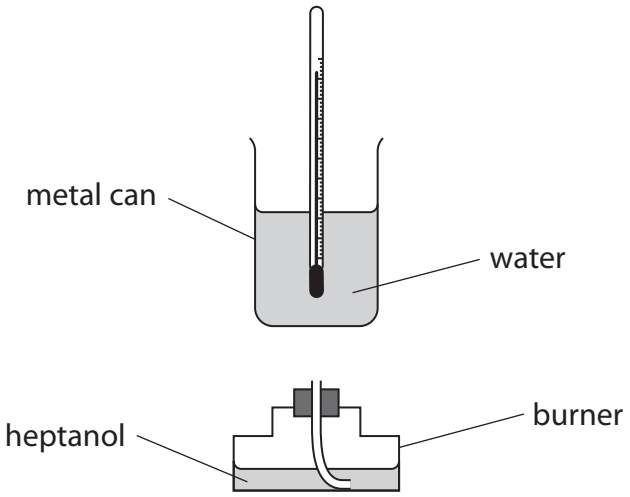
(Total for Question 5 = 8 marks)

BLANK PAGE

6 Heptanol and hydrogen are both used as fuels.

(a) A student uses this apparatus to find the heat energy released from the combustion of heptanol.



He uses this formula

$$Q = m \times 4.18 \times \Delta T$$

[Q = heat energy released, m = mass of water in g, ΔT = change in temperature of water]

1.00 cm^3 water has a mass of 1.00 g.

(i) State the measurements that the student needs to record to find a value for the heat energy released.

(2)

.....

.....

.....

.....

(ii) The student burns 0.75 g of heptanol and calculates Q to be 19 kJ.

Use this information to calculate the molar enthalpy change, in kJ/mol, for the combustion of heptanol.
[M_r of heptanol = 114]

(3)

molar enthalpy change = ... kJ/mol

(b) The equation for the combustion of hydrogen is

$$2H_2 + O_2 \rightarrow 2H_2O$$

(i) This equation shows the reaction, including the covalent bonds in the molecules.

$$2H{-}H + O{=}O \rightarrow 2H{-}O{-}H$$

The table gives the average (mean) bond energies.

Bond	Average bond energy in kJ/mol
H—H	436
O═O	498
H—O	464

Use the values in the table to calculate the enthalpy change, ΔH, for the reaction.

Include the sign in your answer.

(3)

ΔH = ... kJ

(ii) Complete the energy level diagram for the reaction between hydrogen and oxygen by showing the reactants and products.

Label the enthalpy change, ΔH, for the reaction.
